

Have you seen a...

Bumblebee

What Does this Species Look Like?

Size: Just under 1 inch

Color: Yellow and black

General: Fuzzy body, two sets of transparent wings with black veins; Females have pollen baskets on their hind legs

Usually Found: Gardens, grasslands, backyards

Did You Know?

- Bumblebees (*Bombus spp.*) are native to every continent, except Antarctica and Australia.
- Bumblebees feed on the nectar and pollen of flowers. Once they have eaten all the nectar, they use their feet to leave a scent that alerts other bees to avoid the nectar-drained flower.
- Bumblebees are often mistaken for carpenter bees, which can be destructive to human property. A good way to tell them apart is that bumblebees have hairy abdomens, whereas the abdomens of carpenter bees are shiny.
- They rarely sting; only in self-defense or when their nest is threatened.
- Several bumblebee species are becoming very rare, but you can help by planting native flowering species in your garden.

What am I Observing?

The timing (date) of:

- The first sighting of bumblebees
- The first sighting of a bumblebee on a flower
- The last sighting of the bumblebee

Why Collect this Data?

This species is being monitored as a part of the Eastern PA Phenology Program to determine if this insect is impacted by environmental changes.

How Do I Report this Data?

Observations can be reported as comments to the Eastern PA Phenology Blog:
<http://watchingtheseasons.blogspot.com/>
or sent to phenology@lgnc.org
